

Bug Fix Log – BITS Digital CodeForge V2.0

#	Bug / Issue Identified	How it was Reproduced	Root Cause	Fix Implemented	How the Fix was Tested
1	Course list duplicates after uploading another file	Uploaded an initial Excel file, then sequentially uploaded a second Excel file without refreshing.	The application appended new course options to the dropdown without clearing the existing options array first.	Added a reset mechanism to clear existing course options before populating options from the newly uploaded workbook.	Uploaded two different Excel files sequentially and verified that the course dropdown clearly displays only the unique courses corresponding to the active file.
2	Custom grade ranges reset to default upon switching courses	Customized grade cutoffs for Course A, switched to Course B, and then returned to Course A.	Range initialization (buildGradeUI()) was executing inside the course selection change handler, re-triggering default ranges on every switch.	Isolated buildGradeUI() to run strictly once during initial page load so course changes update the roster without overwriting custom cutoffs.	Modified cutoffs for Course A, toggled between courses, and confirmed Course A kept its custom ranges intact.
3	Average shows an incorrect value when no students are present	Selected a course/program category that contained zero student entries or empty records.	The average calculation logic executed directly on an empty dataset, dividing the cumulative score sum by zero, resulting in NaN.	Implemented defensive checking to evaluate array lengths, returning safety fallbacks and gracefully handling empty datasets before calculations run.	Selected a course with no valid records and confirmed that statistics safely display a dash (-) instead of breaking or showing NaN.
4	Missing, text, or "AB"/"Absent" marks dropped from exported CSV	Included a row with text (e.g., "AB") or blank total marks and exported the final CSV.	Score processing logic only checked numeric ranges; if a mark didn't fit a numeric band, it was skipped from counts and CSV output.	Created sanitizeMark() to map blank, non-numeric, or absent entries to NC, and updated getGradeForMark() to preserve them across the UI and CSV export.	Uploaded a sheet containing valid marks and "AB" entries; confirmed "AB" rows appeared in the roster and exported CSV as NC.
5	Excel file picker blocked .xlsx files depending on browser	Attempted to select a standard .xlsx file using the native OS file picker.	The <input type="file"> tag was restricted to accept=".xls", blocking modern Excel files despite xlsx.js support.	Updated the file input attribute to accept=".xlsx, .xls".	Selected a .xlsx sample file using the file picker and verified successful upload and parsing.
6	"Reset Range" button opened two confirmation pop-ups	Clicked the "Reset Range" button once.	The click event listener called confirm() twice in immediate succession.	Removed the extra confirm() invocation so only a single confirmation modal appears.	Clicked "Reset Default" and confirmed only a single prompt appeared.
7	Timer clock visually delays on initialization	Loaded the application interface and observed the timer display element.	The countdown function only initialized updates via setInterval, forcing the clock to sit blank/delayed at 00:00 until the first 1-second tick fired.	Added an immediate initial tick() execution call right inside startTimer() before setting up the recurring interval.	Refreshed the page and verified that the timer immediately renders 00:00 on screen without any initial lag.
